BRED PayZen — TEST Evidence & Endpoint Checks

For: owner/operator and the developer doing the BRED go-live
Prepared by: Mark, developer · 10 November 2026
Related: `BRED_PAYZEN_GO_LIVE.md` §4–§5 · `PAYMENT_SANDBOX_TESTING.md`
Safe to share with BRED: no secret keys on this page. Record references and results, never the Test/Production key or full card numbers.

> **Purpose:** prove the website ↔ PayZen connection works and record the TEST evidence BRED needs before issuing the production key.

---

1. Before you start

1.1 Environment (staging Render service, separate database, key set):

```
PAYMENT_CREDENTIALS_KEY=<staging key>
DDD_DISABLE_CARD=false
PAYMENTS_BRED_ENABLED=true
# GLOBAL_PAYMENTS_PAUSE / PAUSE_CARD_PAYMENTS / PAYMENTS_EXTERNAL_DISABLED unset
```

1.2 Admin → Payments → BRED Bank → Configure

Field	TEST value
Shop Id	8-digit Shop ID from the Back Office
Mode	**TEST** (dropdown)
Test Key	the TEST key (paste)
Production Key	leave empty
Payment Url	empty unless BRED gives a special page

Save, then switch the BRED gateway **active**. Do not make it the guest default yet.

1.3 PayZen Back Office (test shop)

- Notification (IPN) URL = `https://<test-host>/api/payments/webhook/bred-bank`
- Signature = **HMAC-SHA-256**
- Currency **VUV** enabled, whole vatu
- Same-day automatic capture, **3-D Secure** on
- Test cards supplied by BRED / PayZen

---

2. Endpoint checks (run first, no payment needed)

The checker calls the public API, the CSP header, and the IPN route, then sends one **correctly signed probe** for a random order reference — so it proves the key and signature handling without charging anything or changing a payment.

```
BRED_SHOP_ID=12345678 BRED_TEST_KEY='<test key>' \
  npm run check:bred-endpoint -- --base-url https://<test-host>
```

Expected output (4 passes):

```
[PASS] Public gateway list — HTTP 200, 1 visible (cash) — bred-bank hidden from guests (expected while inactive or in TEST mode)
[PASS] CSP form-action — 'self' https://secure.payzen.eu
[PASS] Unsigned webhook rejected — 400 text/plain "Invalid PayZen IPN signature."
[PASS] Signed webhook accepted — 400 text/plain "Payment not found for the notification order reference." — signature verified, unknown order left untouched.
```

How to read a failure:

Check output	Meaning / fix
`Public gateway list` FAIL	Site unreachable, TLS problem, or `/api` not served on that host
`CSP form-action` FAIL	Deployment is old, or the page can't POST to PayZen — redeploy; if BRED gave a custom page, save it in **Payment Url**
`Unsigned webhook` 404 / 405	Wrong host/path, or the webhook route is not mounted
`Signed webhook … Invalid PayZen IPN signature`	**Test Key** in Admin → Payments does not match BRED's test key
`Signed webhook … different PayZen shop`	Shop ID mismatch — check the 8 digits
`Signed webhook … does not match shop mode`	Credential Mode is not the one the probe used (`--ctx-mode`)
`Signed webhook … Gateway is not active`	Switch the BRED gateway active (Admin → Payments)
`Signed webhook` HTTP 500	Deployment predates the unknown-order guard — redeploy

> Optional: pass `--payment-url https://<BRED page>/vads-payment/` to confirm the CSP allows a BRED-specific payment page.

---

3. Round-trip check from the PayZen Back Office

This is the signed, real notification path.

1. In the Back Office, open a TEST transaction (from step 4 below) — or make one test payment first.

2. Use the transaction's **notification / resend IPN** action (label varies with the PayZen version) to send the notification to the URL configured in §1.3.
3. In the Render logs, confirm:
   - `POST /api/payments/webhook/bred-bank 200`
   - `[WEBHOOK][bred-bank]` line with the transaction status
4. The Back Office log shows the reply text; a 200 means the site accepted and processed it.
5. In the site, confirm the payment is `completed` and the booking is `confirmed` (see §5 "Where to look").
6. Repeat the resend — it must **not** confirm twice.

A 400 reply means the notification was rejected; the Render log gives the reason (wrong shop, wrong mode, bad signature). Re-run §2 to locate it.

---

4. TEST scenario evidence log

Fill one row per scenario. Attach screenshots or log lines. **Never write keys or card numbers here** (last 4 digits only).

#	Scenario	Date / time	Order / payment ref	Amount (VUV)	Result seen on site	Evidence (Render log / Back Office ref)	Pass?
1	Successful test-card payment (3-D Secure if prompted)				`completed`, booking `confirmed`, guest + admin e-mail once		☐
2	Declined card				`failed`; booking stays `pending`; hold expires		☐
3	Cancelled / abandoned payment				`cancelled`		☐
4	Replay the same IPN				No second confirmation / no double-charge		☐
5	Unsigned or forged IPN				`400` rejected, nothing changed		☐
6	Wrong amount or currency				`manual_review_required` + admin alert e-mail		☐
7	Full refund in the Back Office				`refunded`, refund reference recorded		☐
8	Partial refund in the Back Office				`completed` with `refunded_amount` set		☐
9	Missed IPN (no notification delivered)				`manual_review_required` + admin e-mail after the window		☐
10	TEST gateway is admin-only				Guest sees no card option; admin can pay		☐
11	**Production:** one controlled live payment				`completed`, booking `confirmed`, IPN logged 200		☐
12	**Production:** refund that payment				`refunded` / refund recorded		☐

Keep the count: BRED may ask how many TEST payments were made before issuing the production key.

Where to look

To confirm…	Look at
Booking paid / confirmed	**Admin** → **Bookings** (status `confirmed`)
Guest sees the result	`/payment/success?booking=…` — flips to Confirmed when the IPN lands
Payment status / refund recorded	Payment record (admin API `GET /api/admin/payments`) or the PayZen Back Office
Stuck or held payment	**Admin** → **Management & Reconciliation** → **Stale Online**
Notification received and its reply	Render logs: `POST /api/payments/webhook/bred-bank`, `[WEBHOOK][bred-bank]`
Bank-side transaction	PayZen Back Office transaction list (order ID = site payment ID)

---

5. Sign-off

Milestone	Name	Date	Reference
TEST complete (all rows 1–10 pass)			
Evidence attached / shared with BRED			
Production key issued by BRED			
Production payment (row 11) verified			
Production refund (row 12) recorded			
Card option enabled for guests			
Rollback plan acknowledged (`PAYMENTS_BRED_ENABLED=false` / `DDD_DISABLE_CARD=true`)			

Go-live is not complete until rows 1–12 pass and this sheet is signed.

---

6. Where the detail is

Document	Use
`BRED_PAYZEN_GO_LIVE.md`	Full runbook: configuration, cutover, refunds, e-mail drafts
`PAYMENT_SANDBOX_TESTING.md`	Field-level TEST-mode reference
`BRED_PAYZEN_BANK_SETUP_SHEET.md`	Plain-language settings to give BRED
`scripts/check-bred-endpoint.mjs`	The endpoint checker used in §2
